Scope Statement

The client was a shy student and wanted to change to connect with other students and attend campus events. The problem is that there are many shy students who don't attend events or aren't part of any activities like clubs because they're nervous about showing up alone. Yes, there are many ways to meet new people on campus like club meetings, workshops, and social events students could be unsure on how to meet new people especially if its students who transfer. The app EventBuddy is an app that's supposed to make it easier for students who are shy to meet other students and attend different events on campus together. It's supposed to make it so that the students who's shy don't feel the social anxiety of going to events alone. This app allows students to make a profile, put what they're interested in on their bio, and be able to find others who have the same interest who wants a friend to go to events with. The app will include a section just for chats so that the students who connect can decide where to meet when they go to events or they can find someone who's more extroverted so that they can accompany them to help them feel a little more comfortable exploring the campus life. Being able to pair more extroverted students with the ones that are shy will help those shy students feel included and could help motivate them to be less shy and come out of their shells which could help them make new friends. All in all this app is for students who are shy to connect with other students like more extroverted ones, join groups (build network), check in to events, find events, and share experiences. This app EventBuddy is similar to social networking apps like BumbleBFF but this app is built specifically for college students and campuses to help connect students around events so that students that are shy don't have to go to social events alone. Some things that this app will not include is public followers count and likes, algorithmic content feeds full of unrelated posts, targeted ads, location sharing to other users, and swipe to like matchmaking.
